# Problem Statement

---

We visit web pages all the time and want to understand the underlying processes. Therefore we want to build our own web server.

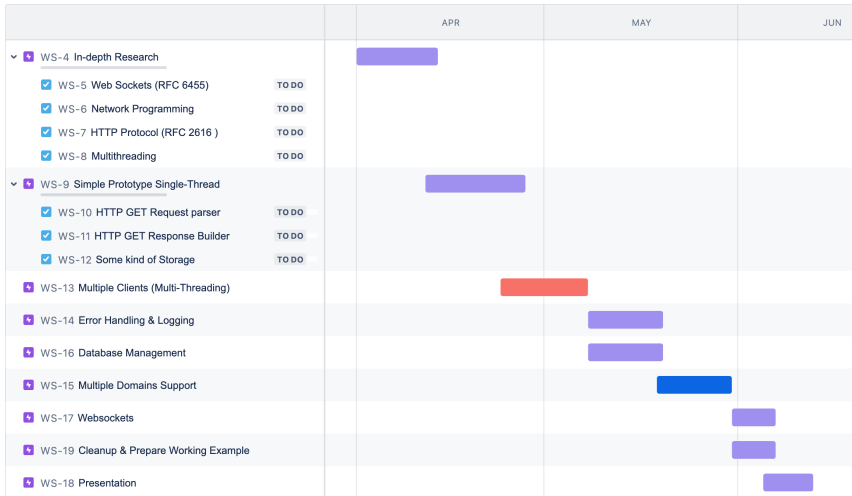

## Proposed solution

---

A multithreaded web server with the following properties:

- › Process HTTP requests
- › Multiple clients can connect
- › Simple database management / concurrent access to resources
- › Error handling: returning correct server errors
- › Log web traffic
- › Handle multiple domains and resources
- › Hopefully: Websocket support

# Preliminary Time Plan
